IP Survey

- Patent Law

The elements of Patentability

- **Patentable subject matter**, i.e., patent eligibility
- **Useful/utility** (operable and provides a tangible benefit)
- **New** (novelty, anticipation)
- **Nonobvious** (not readily within the ordinary skills of a competent artisan at the time the invention was made)
- **Specification requirements / disclosure requirements** (enablement, written description, best mode, definiteness)
**35 USC §101**

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

---

- Patent application for genetically engineered bacteria
  - It had the property of breaking down multiple components of crude oil
  - Its intended application was to treat oil spills (never field tested or applied)
- Claim to the bacteria itself:
  - "a bacterium from the genus *Pseudomonas* containing therein at least two stable energy-generating plasmids, each of said plasmids providing a separate hydrocarbon degradative pathway."
- Various other claims in other claim formats
- Issue – is the bacteria a “manufacture” or “composition of matter” within the meaning of those terms as they apply from 35 U.S.C. §101?

- Mode of analysis (in essence common to all of the patent eligibility cases)
  - First, determine whether the claim is “within” the meaning of one of the four statutory terms
    - Apply statutory interpretation “argument categories”
      - Meaning of the words (statutory definitions, plain meaning, canons of construction, past court opinions on the meaning)
      - Inferences from the provisions or structural characteristics of the statute or other related statutes (same word used in other places in the statute, significance of sectioning, divisions, cross-references, etc.)
      - Legislative History (a number of principles and “canons” are sometimes used to structure use of legislative history; for example, the sometimes employed doctrine that the legislative history should only be authoritative if the statutory language is ambiguous)
      - Policy and/or historical arguments
  - Second, even if the analysis from the first step seems to indicate that the claim is within one of the terms, evaluate whether the claim fits into one of the various remaining exceptions to patent eligibility
    - These exceptions are judicially created, so the mode of analysis looks more like the common law than like statutory interpretation (for example, the line of cases dealing with the now mostly defunct “mathematical algorithm” exception)

- PTO rejection
  - Examiner rejected bacterial claims on two grounds
    - micro-organisms are “products of nature”
    - that as living things micro-organisms are not patentable subject matter under § 101.
      - A new “proposed” exception, or does it fit within one of the three exceptions? (natural phenomenon? but, human-made)

- Meanings of terms
  - Manufacture
    - produce articles for use from raw or prepared materials by giving these materials new forms, qualities, properties, or combinations
  - Composition of matter
    - all compositions of two or more, all composite articles – whether chemical or mechanical union/mixture, whether gases, fluids, powers or solids
  - Both “wide scope” terms

- Legislative History
  - Language of 101 tracks closely with Jefferson’s originally-authored 1793 patent act
  - Embodies Jefferson’s philosophy that “ingenuity should receive a liberal encouragement”
  - Congress intended patentable subject matter to include “anything under the sun that is made by [humans]”
- Exceptions - Physical phenomena?
  - Compare to Funk (US 1948):
    - Applicant discovered certain bacteria whose characteristics where such that when mixed together they assisted the process of nitrogen fixation in plant roots
    - In rejecting the application the court said that the “use in combination does not improve in any way their natural functioning”
    - “they perform in their natural way”
  - Chakrabarty’s bacteria has “markedly different characteristics” from those in nature
  - Chakrabarty transformed the natural bacteria into his own handiwork
- Other considerations
  - Consider the definition of “invention” in §100, which says that “invention” means both “invention and discovery”

- First counter argument
  - 1970 PVPA (sexual reproduction, excluded bacteria)
  - Passage of both acts evidences congressional understanding that “manufacture” or “composition of matter” do not include living things – if they did, neither act necessary
    - Only one specific PPA legislative history provision stating that “the patent laws . . . at the present time are understood to cover only . . . inanimate nature”
  - Not persuasive because there were other reasons to pass both acts
    - PPA – work of the breeder “in aid of nature” was patentable
      - Prior to 1930, even artificially bred plants considered “products of nature” (an instance of “natural phenomena”)
      - Written description problem for plant patent (may differ only by color or perfume) (relaxed by PPA)
      - Relevant distinction is not between living and inanimate things, but between products of nature, whether living or not, and human-made inventions
    - PVPA – sexually reproduced plants not included in PPA because new varieties could not be reproduced true-to-type through seedlings in 1930
      - PVPA excluded bacteria (i) simply in agreement with a court case that held that bacteria were not plants under PPA, or (ii) because prior to 1970 the PTO had granted some patents on bacteria

- Second counter argument – need Congress to authorize patents on micro-organisms, genetic technology unforeseen when §101 enacted
  - *Flook*: the judiciary “must proceed cautiously when . . . asked to extend patent rights into areas wholly unforeseen by Congress”
  - Congress has spoken, court says it is simply doing its *Marbury* duty to say what the law is – high policy choice is not for the court and has already been made by congress
  - Congress is free to amend to exclude these inventions, and has similarly done so for nuclear weapons technology

---

**Madey v. Duke Univ., 307 F.3d 1351 (Fed. Cir. 2002)**

- **Embodiments**
  - An infrared FEL called the “Mark III FEL,” embodying the ’994 patent and the ’103 patent (by incorporating the microwave electron gun in the infrared FEL).
  - A “Storage Ring FEL,” embodying the same patents as the Mark III FEL because it incorporates a Mark III FEL.
  - A “Microwave Gun Test Stand,” embodying the ’103 patent (by incorporating the microwave electron gun).
**Problem**

Phillips Modular Wall (PMW) is a nonprofit that makes modular wall sections for easy construction of temporary housing. Their biggest customers are other nonprofit entities that setup housing after disasters, such as hurricanes, or for the homeless. In its R&D lab, PMW devises a new type of optical microscope. Unbeknownst to PMW, a U.S. patent is in force at the time PMW devised and began using the microscope. The PMW microscope is an embodiment of claim 1 in that patent. Putting aside any questions about what monetary damages amounts might or might not flow if the acts where infringement, which of the following are acts of infringement?

1. During manufacturing, PMW uses the first microscope to examine the welds on its walls to ensure quality.
2. PMW makes a second microscope exactly the same as the first and donates it to the optometry department of a local university. A professor there studies it to discover how it works, and uses it to expose six images to a digital camera. Then she puts the images on her web site with an explanation of how the microscope works. Thereafter, she retires the microscope to the school museum.
3. A chemistry professor at the local university sees the microscope in the school museum and secures permission from the optometry professor to remove it to his lab. There he regularly uses it to study the structure of different welding patterns on metal in furtherance of his research grant from the (hypothetical) National Welding Quality Assurance Society.
4. PMW makes a third microscope and donates it to a local public high school. The school uses it in the physics lab as another educational tool to help teach high school physics.
5. The high school physics lab technician doesn’t know where the microscope came from. From her perspective, it just showed up one day. She likes the microscope so much that she searches in the marketplace for it and finds the patent owner as a supplier. Never realizing it is a different source of supply, she purchases six microscopes from the patent owner.
6. The lab technician sells the donated microscope and one of the purchased microscopes to QOX, a for-profit competitor of PMW. QOX uses both to inspect welds in its manufacturing line. Later, QOX sells both to RPY, a regular microscope purchaser from the patent owner.

---

According to well-established principles of equity, a plaintiff seeking a permanent injunction must satisfy a four-factor test before a court may grant such relief. A plaintiff must demonstrate:

1. that it has suffered an irreparable injury;  
2. that remedies available at law, such as monetary damages, are inadequate to compensate for that injury;  
3. that, considering the balance of hardships between the plaintiff and defendant, a remedy in equity is warranted; and  
4. that the public interest would not be disserved by a permanent injunction.

The decision to grant or deny permanent injunctive relief is an act of equitable discretion by the district court, reviewable on appeal for abuse of discretion.
Claims

- Claims are the heart of the patent system
- **Inventors** are those who thought of something covered by the claims, not those who learned it from someone else
  - You may not know who they are until claims are drafted
- Claims define the scope of coverage of the right to exclude
- Those who **operate within the language of the claim** are subject to an infringement action

Patent – claims

1. A **seating apparatus**, **comprising**:
   (a) a horizontal **seat**; and
   (b) three **legs** each having one end connected to the **bottom** of said horizontal **seat**.

1. A device for supporting objects, **comprising**:
   (a) a horizontal support member; and
   (b) three vertical support members each having one end connected to the same face of said horizontal support member.

New Product

TriStool
Claim Example

- Client shows you a machine she has devised. It has:
  - Chassis
  - 4 wheels
  - 10-cylinder engine
  - Brake on each wheel
  - 3-speed transmission

- How to Claim?
  - Rule 1 - as broad as possible but must not cover any previously known configuration.
  - Rule 2 - Claim must embrace something the inventor devised

- Assume that the closest previously known machine is the horse-drawn wagon

- Claim 1:
  - A vehicle, comprising:
    - a chassis;
    - a plurality of wheels attached to said chassis; and
    - an engine for turning one of said wheels.

- Goals
  - Don't give up broadest claim scope
  - Write many other, narrower, claims in case Claim 1 is found to violate Rule 1.

Claim Example (cont’d)

- New information on prior art
  - You learn at some point that the locomotive pre-existed your client's development of the car

- This generates a need to amend the claim

- (amended) Claim 1:
  - A vehicle, comprising:
    - a chassis;
    - a plurality of wheels attached to said chassis;
    - an engine for turning one of said wheels;
    - A steering device for turning at least one of said wheels.
Claim elements/limitations

- In claims using the transition word “comprising,” adding more elements/limitations makes the claim more narrow (i.e., there are a smaller number of items that might be covered by the claim)
  - There are other ways to make the claim more narrow, this is not the only way
- For example, arrange these three claims from most to least broad:

Claim 1
- A device for supporting objects, comprising:
  - (a) a horizontal support member; and
  - (b) three vertical support members each having one end connected to the same face of said horizontal support member.

Claim 3
- A seating apparatus, comprising:
  - (a) a horizontal seat;
  - (b) three legs each having one end connected to the bottom of said horizontal seat; and
  - (c) said connection between said legs and bottom of said horizontal seat being a slim metal piece partially traversing some of said leg and said seat.

Claim 2
- A seating apparatus, comprising:
  - (a) a horizontal seat; and
  - (b) three legs each having one end connected to the bottom of said horizontal seat.

Patent – claims

<table>
<thead>
<tr>
<th>Ver. I</th>
<th>Ver. II</th>
<th>Ver. III</th>
<th>Ver. IV</th>
</tr>
</thead>
<tbody>
<tr>
<td>Narrow</td>
<td></td>
<td></td>
<td>Broad</td>
</tr>
</tbody>
</table>

1. A seating apparatus, comprising:
   - (a) a horizontal circular seat;
   - (b) three vertical legs of equal length each having one end connected to the bottom of said horizontal seat; and
   - (c) three horizontal support members connecting said three vertical legs

1. A seating apparatus, comprising:
   - (a) a horizontal seat; and
   - (b) three legs each having one end connected to the bottom of said horizontal seat.

1. A seating device, comprising:
   - (a) a flat, substantially elliptical board;
   - (b) three rods, each connected at one end to the same side of said board;
   - (c) wherein the point of connection between each rod and said board is located an equal distance from the point of connection of every other rod

1. A device for supporting objects, comprising:
   - (a) a horizontal support member; and
   - (b) three vertical support members each having one end connected to the same face of said horizontal support member.
**Dependent claims**

1. A seating apparatus, comprising:
   (a) a horizontal seat; and
   (b) three legs each having one end connected to the bottom of said horizontal seat.

**Examples of dependent claims:**

2. *The seating apparatus of claim 1* further including rubber caps at the end of each said leg opposite the end of said leg connected to the bottom of said horizontal seat.
3. *The seating apparatus of claim 1* wherein the said horizontal seat is made from wood.
4. *The seating apparatus of claim 3* wherein the wood is one of the following types: oak, mahogany or ash.

General rule of “claims scope”: the independent claim is always “broader” than its dependent claims.

“comprising” is a magic word. It makes the claim “open-ended” - any device or method that includes all the limitations after the word comprising will infringe, e.g. a four-legged stool infringes claim 1.

---

**More on claims – visualizing dependent claims**

- Dependent claims are often visualized in a tree hierarchy

```
C1: seat & legs
   
   C2: & caps
   
   C3: & seat is wood
      
      C4: & wood is O, M or A
```

- Most broad and abstract (More devices will infringe, BUT, greater risk for invalidity challenge)
- Least broad and abstract (less devices will infringe, BUT, greater ability to withstand invalidity challenge)
More on claims – labeling elements/limitations

- Patent attorneys use a shorthand for discussing claim elements/limitations
- That shorthand is to use a symbol, often letters, for each major component or subdivision, or major qualifier in the claim language

Most broad and abstract
(More devices will infringe, BUT, greater risk for invalidity challenge)

C1: AB
C2: AB C
C3: AB D
C4: ABD E

Least broad and abstract
(less devices will infringe, BUT, greater ability to withstand invalidity challenge)

C1: AB
C2: AB C
C3: AB D
C4: ABD E

Patent Document Terminology

</tr>
</tbody>
</table>

#### Specification

- **modular wall section**
  - **A** – outer metal shell
  - **B** – seal
  - **C** – baffling means

Search for corresponding structure; such structure provides the specific meaning for this claim limitation

### Example Patent - U.S. Pat. No. 5,505,330 (Nunes)

U.S. Patent

**United States Patent**

- **Patent: Number:** 5,505,330
- **Date of Patent:** Apr. 1, 1996

**Figures:**

- **Fig. 1**
- **Fig. 2**
- **Fig. 3**

**Patent Description:**

- **Abstract:**
- **Drawings:**
- **Claims:**
- **Description:**

**Inventor:**

- **Name:**
- **Inventor:**

- **Assignee:**

**Legal Status:**

- **Status:**
- **Date:**
- **Current Assignee:**
Phillips v. AWH Corp., 415 F.3d 1303 (Fed. Cir. 2005) (en banc)

- Degree of influence on meaning for the claim term “baffle” from:
  - The dictionary
  - The disclosure (“specification”)
  - Function intended for structure recited in the claim
- Internal versus External sources of meaning and context
Problem

A handle for a beverage can, comprising:
- a handle body;
- a top connector;
- a bottom connector;
- a flexible joint that facilitates the attachment of the handle to the beverage can;
- and
- a handle grip connected between the top connector and the bottom connector;
wherein the handle grip further comprises one or more bulbous handle portions forming the handle grip.

1. Dependent claim 2 is as follows: “2. The handle for a beverage can of claim 1, further comprising a vertical height in the range of four inches to five inches.” Would an AID the same as Diagram 1 that is half a foot high literally infringe if made in the United States?

2. You make AID₁ in the United States and it is the same as Diagram 1, 4.5 inches high, made of steel, but painted pink. AID₂ is the same as AID₁, but is made of pink fiberboard. Do either AID₁ or AID₂ or both literally infringe claim 1, or claim 2 from the prior problem? Would your analysis change if the fiberboard was not pink? Would your analysis change if claim 1 instead recited “a plastic handle body” for limitation A, but claim 2 retained its form as given in the prior note?

3. The specification of the patent containing claim 1 makes this statement: “the handle body should be made of a pliable plastic.” AID₃ is the same as Diagram 1, but its handle body is made of styrofoam. A POSITA would testify that styrofoam is pliable, but no POSITA would state that styrofoam is made of, or similar to, plastic. What might the claim construction for the handle body limitation look like? What are the chances of meeting that claim limitation literally for AID₃? Would your analysis change if claim 1 instead recited “a plastic handle body” for limitation A?

1. Dependent claim 2 is as follows: “2. The handle for a beverage can of claim 1, further comprising a vertical height in the range of four inches to five inches.” Would an AID the same as Diagram 1 that is half a foot high literally infringe if made in the United States?

4. Is owning a U.S. patent claiming ABCD infringement of a claim in a third party U.S. patent to ABCD? Your only act was to purchase the patent claiming ABCD. Thereafter you let the patent sit in your desk drawer in Chicago. In this problem, ignore any consternation that reasonably might arise as to having two patents issued for the same invention; it happens more often than you might expect.

5. You own a U.S. patent claiming ABCDE. You discover someone in Hong Kong making and selling an AID that embodies ABCDE. What recourse does your U.S. patent provide?
Specification Requirements – Objective Disclosure Requirements

- Enablement is the central doctrine
  - It fulfills the “public disclosure” part of the patent bargain
  - It helps delimit the boundaries of patent protection by ensuring that the scope of a patent claim accords with the extent of the inventor’s technical contribution

- Written description doctrine
  - Historical role in policing new matter
  - Role as a standalone requirement

§§ 112(a)-(b) Language

(a) In General.-The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same, and shall set forth the best mode contemplated by the inventor or joint inventor of carrying out his invention.

(b) Conclusion.-The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the inventor or joint inventor regards as the invention.

- Claim term at issue
  - “spaced relationship”

- Revising the standard

In place of the “insolubly ambiguous” standard, we hold that a patent is invalid for indefiniteness if its claims, read in light of the specification delineating the patent, and the prosecution history, fail to inform, with reasonable certainty, those skilled in the art about the scope of the invention.
Halliburton Energy Servs. v. M-I LLC, 514 F.3d 1244 (Fed. Cir 2008) [NOT ASSIGNED]

1. A method for conducting a drilling operation in a subterranean formation using a *fragile gel* drilling fluid comprising:
   (a) an invert emulsion base;
   (b) one or more thinners;
   (c) one or more emulsifiers; and
   (d) one or more weighting agents, wherein said operation includes running casing in a borehole.

- **Claim construction of “fragile gel”**
  - no or low organophilic clay or lignite issue
  - Preamble phrase; why is it limiting?
  - Two aspects of the claim construction
    - 1) A gel that easily transitions to a liquid state upon the introduction of force (e.g., when drilling starts) and returns to a gel when the force is removed (e.g., when drilling stops); and
    - 2) At rest, is capable of suspending drill cuttings and weighting materials

- Is “fragile gel” definite?
  - A POSITA cannot determine how quickly the fluid will return to the liquid state, or its capacity for suspending drill cuttings and weighting materials compared to “synergistically effective amount”

---

**Note on the presumption of validity**

A patent shall be presumed valid. Each claim of a patent (whether in independent [or] dependent . . . form) shall be presumed valid independently of the validity of other claims; . . . dependent claims shall be presumed valid even though dependent upon an invalid claim. . . . The burden of establishing invalidity of a patent or any claim thereof shall rest on the party asserting such invalidity.

- **Standard of proof**
- **Pros / cons of that standard?**

20. Apparatus for wet processing of semiconductor wafers comprising:
(a) vessel means for supporting said wafers in a closed circulation process stream wherein process fluids may sequentially flow past said wafers and
(b) means for supplying at least one chemical reagent to said process stream for reacting with portions of said wafers, said process stream being positioned within said vessel means such that said vessel means is hydraulically full with process fluid.

- Claim construction for “cleaning,” “treatment,” and “wet processing”
- Embodiments
  - Prototype that can clean penciled grease marks
  - Full Flow system for TI
- Success and/or failure with embodiments
- Effect of follow-on patent

How to think about Enablement

- Based on a number of factors, any experimentation required may or may not be “undue” – if it is “undue” the claim is not enabled
- The specification provides some additional level of information disclosure pertinent to making and using the claimed invention
- A POSITA would know some base level of information
### Note on CFMT, Inc. v. YieldUp - embodiments

<table>

### Enablement – undue experimentation – Wands factors

- quantity of experimentation necessary
- amount of direction or guidance provided
- presence or absence of working examples
- nature of the invention
- state of the prior art
- relative skill of those in the art
- predictability or unpredictability of the art
- the breadth of the claims
Problems

Alpha owns the '123 patent where claim 1 is: a cleaning fluid comprising: (a) 5-15% hydroxide detergent; (b) 2-10% scrubbing bubble facilitator fluid (SBFF); (c) an effective amount of mixing agent; and (d) balance water. The inventor is Smith, an employee of Alpha. This problem will model claim 1's four limitations symbolically as ABCD. An embodiment of claim 1 will implement actual percentages for all four limitations, and POSITAs understand that the sum will equal one hundred percent. For this set, any facts stated in a particular problem apply in all problems. 

1. POSITAs are familiar with mixing agents for hydroxide detergent based cleaning fluids. Such mixing agents are easy to figure into a composition. The only mentions in the '123 patent specification about the mixing agent are that the most effective cleaning action occurred around 5%, that the JohnsonReMix agent was ineffective at all plausible percentages, and that some mixing agent was absolutely necessary. It turns out, however, that Alpha did not understand how to use JohnsonReMix; their directions in the specification incorrectly say how to use it. Beta makes and sells a first accused infringing product (AID₁) that clearly has A, B, & D. For the mixing agent, AID₁ uses the JohnsonReMix product at 6% because Beta understood the proper way to use JohnsonReMix. Proffer a claim construction on behalf of Beta for limitation C in claim 1 with the objective of avoiding infringement with AID₁. What might Alpha's claim construction look like in response? Assess Beta's ability to prevail on a definiteness or enablement challenge for limitation C.

2. No POSITA has ever heard of the term “scrubbing bubble facilitator fluid.” Alpha's factory discharges numerous types of foaming agents in varying quantities into a big vat for pickup each week. Within the factory it uses several dozen foaming agents. Smith simply takes material from the big vat as his SBFF to make the claim 1 cleaning fluid. POSITAs know how to use individual foaming agents, but do not know how to combine them. The '123 patent specification does not discuss foaming agents nor does it give any details about SBFF. Assess Beta's ability to prevail on a definiteness or enablement challenge for limitation B.
35 USC §101

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

Patent Eligibility - Process

- 35 U.S.C. 100(b)
  - The term "process" means process, art or method, and includes a new use of a known process, machine, manufacture, composition of matter, or material.

- Modern test of the bounds of the broad term “process” has been in relation to computer software
  - Is software more like abstract principles and mental steps or like implemented electronic circuits?
The Domain of Patent protection . . .

Products & Processes

Assn. of Molecular Pathology v. Myriad Genetics, __ U.S. __ (2013)

‘252 claim 1: An isolated DNA coding for a BRCA1 polypeptide, said polypeptide having the amino acid sequence set forth in SEQ ID NO:2.

- Isolated DNA sequence
- cDNA sequence

cDNA does not present the same obstacles to patentability as naturally occurring, isolated DNA segments. As already explained, creation of a cDNA sequence from mRNA results in an exons-only molecule that is not naturally occurring.
**“Step Change” in Patent Law - Abstract Ideas & Business Methods**

- Eligible Subject Matter

- Disclosure Requirements

Increasingly abstract software claims but no adjustment of disclosure requirements

1985  2000  2010

**Alice Corp. Pty. Ltd. v. CLS Bank Intl (2014)**

- Preemption concern
- Two-Step “Test”

In Mayo, we set forth a framework for distinguishing patents that claim laws of nature, natural phenomena, and abstract ideas from those that claim patent-eligible applications of those concepts. First, we determine whether the claims at issue are directed to one of those patent-ineligible concepts. If so, we then ask, “[w]hat else is there in the claims before us?” To answer that question, we consider the elements of each claim both individually and “as an ordered combination” to determine whether the additional elements “transform the nature of the claim into a patent-eligible application. We have described step two of this analysis as a search for an “inventive concept”—i.e., an element or combination of elements that is “sufficient to ensure that the patent in practice amounts to significantly more than a patent upon the ineligible concept itself.”

[footnote] Because the approach we made explicit in Mayo considers all claim elements, both individually and in combination, it is consistent with the general rule that patent claims “must be considered as a whole.” *Diamond v. Diehr*, 450 U.S. 175 (1981).

claim 33: A method of exchanging obligations as between parties, each party holding a credit record and a debit record with an exchange institution, the credit records and debit records for exchange of predetermined obligations, the method comprising the steps of:

(a) creating a shadow credit record and a shadow debit record for each stakeholder party to be held independently by a supervisory institution from the exchange institutions;

(b) obtaining from each exchange institution a start-of-day balance for each shadow credit record and shadow debit record;

(c) for every transaction resulting in an exchange obligation, the supervisory institution adjusting each respective party’s shadow credit record or shadow debit record, allowing only these transactions that do not result in the value of the shadow debit record being less than the value of the shadow credit record at any time, each said adjustment taking place in chronological order, and

(d) at the end-of-day, the supervisory institution instructing on[e] of the exchange institutions to exchange credits or debits to the credit record and debit record of the respective parties in accordance with the adjustments of the said permitted transactions, the credits and debits being irrevocable, time invariant obligations placed on the exchange institutions.
**In re Bilski (Fed. Cir. 2008) (en banc) [NOT ASSIGNED]**

- Claimed method does not transform an “article”
  - Machine-or-Transformation (MoT) is THE test
  - Need meaningful limits on claim scope
  - Field preemption prevention policy concern (vs. particular application)
- “articles”
  - “The raw materials of many information-age processes, however, are electronic signals and electronically-manipulated data.”
  - Make it a “different state or thing”
  - Too abstract to be an article: “legal obligations, organizational relationships, and business risks.”
- Data that represents physical and tangible objects/substances is an “article”

**Bilski v. Kappos, 130 S. Ct. 3218 (2010) [NOT ASSIGNED]**

- Some methods of doing business might pass muster as a “process” under section 101
  - After State Street, Congress enacted a type of “prior user rights” for methods of doing business
  - This foreclosed an interpretation where one might say “no business methods can be a ‘process’ in a section 101 sense”
- The “machine-or-transformation” test is not the only test for when a claim recites a qualifying “process”
- Emphasis is still on the need for limits on the claim to make it non-abstract
  - Field preemption prevention policy concern (vs. particular application)
**Bilski v. Kappos, 130 S. Ct. 3218 (2010) [NOT ASSIGNED]**

- Commentary on the machine or transformation test and on business methods as claimed processes:
  
  n.8 This Court's precedents establish that the machine-or-transformation test is a useful and important clue, an investigative tool, for determining whether some claimed inventions are processes under § 101. The machine-or-transformation test is not the sole test for deciding whether an invention is a patent-eligible "process." . . . the machine-or-transformation test would create uncertainty as to the patentability of software, advanced diagnostic medicine techniques, and inventions based on linear programming, data compression, and the manipulation of digital signals . . . Interpreting § 101 to exclude all business methods simply because business method patents were rarely issued until modern times revives many of the previously discussed difficulties . . . At the same time, some business method patents raise special problems in terms of vagueness and suspect validity. See eBay Inc. v. MercExchange, L.L.C., 547 U.S. 388, 397 (2006) (KENNEDY, J., concurring). The Information Age empowers people with new capacities to perform statistical analyses and mathematical calculations with a speed and sophistication that enable the design of protocols for more efficient performance of a vast number of business tasks. If a high enough bar is not set when considering patent applications of this sort, patent examiners and courts could be flooded with claims that would put a chill on creative endeavor and dynamic change.

---

**Juicy Whip, Inc. v. Orange Bang, Inc., 185 F.3d 1364 (Fed. Cir. 1999)**

- Juicy Whip’s patent is for “post-mix” beverage dispenser that simulates the presentation of a “pre-mix” beverage dispenser
- District court, on S/J, held patent invalid
  - Purpose is to increase sales by deception
  - Other claimed usefulness (eliminating need to clean) is not independent of deceptive purpose and thus insufficient to raise a genuine issue of material fact
  - Improves prior art only by making the product more saleable
  - Is merely an imitation of a pre-mix dispenser
**Juicy Whip v. Orange Bang**

- Utility threshold is not high
  - merely need some identifiable benefit, useful result, or beneficial end
- District court applied two pre-1952 Second Circuit cases about creating artificial impressions of higher quality
  - “Spotting” unspotted tobacco leaves
  - “Seaming” seamless hosiery
- These cases do not represent the modern state of the utility doctrine
  - The fact that one product can be altered to make it look like another is in itself a specific benefit sufficient to satisfy the utility requirement
  - Product imitation is not unusual
  - It is not unlawful to display the simulated beverage
  - Utility requirement is not meant to make the courts or the PTO be arbiters of deceptive trade practices

---

**Types of Utility**

- operability
- beneficial/moral utility
- immediate benefit to the public, i.e., substantial utility, with its synonyms of practical and real-world utility
- specific utility, seeking to tie the utility to the claimed subject matter
- credible utility, so that the utility is provable to a POSITA.

From 2001 Revised Utility Guidelines: For example, a claim to a polynucleotide whose use is disclosed simply as a “gene probe” or “chromosome marker” would not be considered to be specific in the absence of a disclosure of a specific DNA target.
**preAIA: Novelty and Bars (patent defeating events) in §102**

- **Novelty**
  - sections (a), (e) & (g)
  - the age of the prior art reference is earlier
  - “keyed” to the date of invention
  - “first to invent” priority system

- **Statutory Bars**
  - sections (b) & (d)
  - if I delay I am **barred**
  - “keyed” to the filing date

- **Other patent-defeating events**
  - abandonment - §102(c)
  - derivation - §102(f)

---

**PostAIA: First to File, or, First to Publish to bar others, in §102**

<table>
<thead>
<tr>
<th>First to File Attribute</th>
<th>Novelty</th>
<th>Priority</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>When no novelty defeating events exist as described immediately to the right. It is strong because anyone who files will be blocked by a novelty defeating event.</td>
</tr>
<tr>
<td><strong>Novelty</strong></td>
<td></td>
<td>The first to file establishes, by using a <strong>novelty defeating event</strong> in §102(a)(2) (patents, publications, public uses, sales, otherwise available) that the public disclosure in the sense of §102(b) immediately defeat novelty for all but the person who made the disclosure (or if instead obtained the subject matter from such person and publicly disclosed it).</td>
</tr>
<tr>
<td>First to File</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>First to Publish Attribute</th>
<th>Novelty</th>
<th>Priority</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>When a public disclosure of a novelty defeating event dates to do so, as “first to publish” the priority race because she has blocked others, so long as she files within one year of the disclosure, see, in part, §102(b)(1)(B).</td>
<td></td>
</tr>
<tr>
<td><strong>Priority</strong></td>
<td></td>
<td>The first to publish characteristic gives (arguably) a strong and a weak grace period, one year in length in either case.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The strong grace period is described immediately to the right. It is strong because anyone who files will be blocked by a novelty defeating event.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The weak grace period derives from the word “publicly” in §102(b)(1)(A) as contrasted with “public disclosure” elsewhere in §102(b) in light of case law interpreting pre-AIA public use and on sale events, and arguments from the subsumed interplay of post-AIA sections 102(a) and 102(b).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Under “public use,” the pre-AIA case law treated commercially beneficial events or a later claimed invention as the critical date (if before the critical date) for that commercializing user who later files.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The weak grace period is the one-year period that the commercializing user (arguably) has under the AIA to file. It is weak because a public disclosure by another will cut off the weak grace period.</td>
</tr>
</tbody>
</table>
**Prior Art References**

- “anticipating” references are part of the analysis for both novelty and statutory bar patent defeating events
- What is an “anticipating” reference? (answered different ways that mean the same thing)
  - The reference “has” all the elements of the claim
  - The claim covers what is disclosed by the reference
  - The claim reads upon (or “reads on”) the reference

**preAIA §102(b)**

102(b) – if the applicant does not file within one year of the date of the prior art reference or activity, then the patentee is barred from applying for the patent.

<table>
<thead>
<tr>
<th>Status</th>
<th>Condition</th>

</tr>
</tbody>
</table>

“the invention was known or used by others in this country, or patented or described in a printed publication in this or a foreign country, before the invention thereof by the applicant for patent”

---

### bars/novelty – prior art references & anticipation

**preAIA**: the publication bars the claim if greater than one year

**postAIA**: the publication invalidates the claim if before the effective filing date

- Time
- Public use (by another)
- File date
- Claim
- Modular wall section
  - A – outer metal shell
  - B – seals
  - C – baffles

**preAIA**: the public use bars the claim if greater than one year (if there is anticipation)

**postAIA**: the public use invalidates the claim if the effective filing date (if there is anticipation)

- Time
- Public use (by another)
- File date
- Claim
- Modular wall section
  - A – outer metal shell
  - B – seals
  - C – baffles
“Printed Publication” – *In re Hall (Fed. Cir. 1986)*

- Hall’s effective filing date is 2/27/79
- During September 1977 the anticipating doctoral thesis of Dr. Foldi was submitted to the Dept. of Chemistry and Pharmacy at a university in Germany
- German library says that its dissertations are made available to the public by being cataloged, indexed and placed in the collection
- Dr. Foldi’s thesis was likely available for general use during December 1977
  - This is based on library’s estimation of its typical timeliness in processing received dissertations
  - The known date of receipt was in November, 1977
- Implications if the library’s estimate is incorrect by 3 months?
  - This would put the library cataloging/indexing of the dissertation into March 1978 – how would this impact the outcome?

---

**Egbert v. Lippman (1881)**

- How does Egbert deal with the following considerations in determining whether a use is “public use”?
  - Number of articles in use?
  - Number of users?
  - Significance of public observation?
  - Number of observers?
  - Extent to which observers understand the disclosed technology?
- Significance of efforts to keep it secret?
  - Presence or absence of a confidentiality agreement?
  - Can close personal relationships substitute?
City of Elizabeth v. Pavement Co. (1877)

- Experimental use doctrine
  - If the doctrine applies, then the public use is not a patent defeating statutory bar event under §102
- Fundamental inquiry
  - *is the use necessary to demonstrate workability of the invention, i.e., suitability for its intended purpose*
- Does doctrine apply to Mr. Nicholson’s road pavement invention?
  - Abandonment is not the issue here

City of Elizabeth v. Pavement Co. (1877)

- Must experiment on street pavement in public
  - Some experiments, such as for durability, may take time
  - A use is not a “public use,” even if the public benefits, if the use is still an experiment
- Nicholson’s situation
  - He controlled the experiment, had consent and performed it on the premises of the company he had some influence over
  - Experiment had the valid purpose of testing for durability and needed the public venue to properly test this characteristic
  - While it was a long test, the length seems reasonable
  - Users did not pay any additional amounts for the use of the invention, the road was already a toll road
  - Mr. Nicholson was constantly inspecting the road and monitoring its performance, asking the toll gate operator how travelers liked it
**Experimental Use factors**

- Factors for experimental use exception to public use statutory bar – to help determine whether the experiment is leading to an actual reduction to practice:
  - Control by inventor (most important)
  - Confidentiality / secrecy agreements
  - Necessity of public testing
  - Length of test period, number of prototypes
  - Did users pay? Commercial exploitation?
  - Progress reports, monitoring, records of performance
  - The experiment must be for claimed features of the invention, or perhaps for general purpose/utility of the invention
  - Are experiments hidden?

**The obviousness inquiry**

- State of the Art
- Nonobviousness “Patent-free” zone

No Hindsight!!
§103 – The obviousness inquiry

- A patent may not be obtained notwithstanding that the claimed invention is not identically disclosed as set forth in section 102 [distinguishes from novelty],
- if the differences between [(2) ascertain differences] the claimed invention
- and
  - the prior art are such that [(1) scope & content] the claimed invention [A] as a whole [B] would have been obvious [C] before the effective filing date of the claimed invention [D] to a person having ordinary skill in the art to which the claimed invention pertains. . . . [(3) assess level of skill]

- Patentability shall not be negatived by the manner in which the invention was made

§103 – The obviousness inquiry

- Fundamental Inquiries
  - (1) scope & content of the prior art
  - (2) ascertain differences between
    - the claimed invention & the prior art
      - As a whole; claim by claim
    - for the claims at issue on a claim by claim basis
  - (3) assess level of skill of a POSITA
  - (4) “secondary” or objective indicia
    - One formulation of the list of these indicia
      - Commercial success
      - Long-felt but unsolved need
      - Failure of others
      - Prompt copying, licensing
      - Unexpected results
      - Recognizing the problem
      - Teaching “away”
      - Results unexpected
      - Disbelief / incredulity
Graham v. John Deere Co. (US 1966) [not assigned]

- Split among the circuits on Graham’s ’798 plow shank patent
  - The 8th circuit says that the patent is invalid
    - ultimately affirmed by the Supreme Court
    - 8th applied the traditional standard of “invention”
  - The 5th circuit said that the patent was valid
    - It produced an old result in a cheaper and otherwise more advantageous way

Graham – how to deal w/ the statutory change

- How to draw the line
  - "between the things which are worth the public embarrassment of an exclusive patent and those which are not"
  - Jefferson only wrote the utility and novelty requirements into the original patent act
- Hotchkiss (US 1851)
  - (U)neless more ingenuity and skill . . . were required . . . than were possessed by an ordinary mechanic acquainted with the business, there was an absence of that degree of skill and ingenuity which constitute essential elements of every invention. In other words, the improvement is the work of the skillful mechanic, not that of the inventor
- 103 codifies this “additional” requirement of patentability
- Recharacterize “invention” test as a “label”
- Clear emphasis on new word – nonobviousness
  - Difference between the subject matter sought to be patented and the prior art
  - New statutory language not intended to change the general level of “patentable invention”
  - as evidenced by the legislative history’s apparent references to Hotchkiss

“first administrator of our patent system”
Two items are different in the '798 patent compared to the '811 patent:

- Stirrup and bolted connection
- Position of the shank, moved from above the hinge plate to below it
Graham

{1} scope & content of the prior art
- Graham ‘811
- Glencoe device
  - Shank is above hinge plate, like the ‘811 patent, but it provides a stirrup about which the hinging action occurs.

{2} ascertain differences between
- the subject matter sought to be patented & the prior art
  - Graham ‘811
    - Does not have the stirrup & bolt
    - The shank is above the hinge plate
  - Glencoe
    - The shank is also above the hinge plate
    - Has the stirrup and has a bolt
- for the claims at issue on a claim by claim basis

{3} assess level of skill of a POSITA
- The court notes that Graham’s expert stated that “flexing” in the ‘798 patent was not a significant feature
- Without documenting much of its basis for saying so, the court determines that this change in the cooperation among the elements would have been obvious
  - In large part based on the belief that a POSITA would have instantly thought so
- What is the “flexing” argument? Why is it rejected by the court?

{4} “secondary” or objective indicia
- The court does not do much with its quote:
  - Such secondary considerations as commercial success, long felt but unsolved needs, failure of others, etc., might be utilized to give light to the circumstances surrounding the origin of the subject matter sought to be patented. As indicia of obviousness or nonobviousness, these inquiries may have relevancy.
- However, this quote becomes the basis for significant development of this fourth fundamental inquiry by the Federal Circuit
Other obviousness examples

Assume that G did not exist at all in any field of technology before the inventor’s conception.

For a designer starting with Asano, the question was where to attach the sensor. The consequent legal question, then, is whether a pedal designer of ordinary skill starting with Asano would have found it obvious to put the sensor on a fixed pivot point. The prior art discussed above leads us to the conclusion that attaching the sensor where both KSR and Engelgau put it would have been obvious to a person of ordinary skill.

The '936 patent taught the utility of putting the sensor on the pedal device, not in the engine. Smith, in turn, explained to put the sensor not on the pedal’s footpad but instead on its support structure. And from the known wire-chafing problems of Rixon, and Smith’s teaching that “the pedal assemblies must not precipitate any motion in the connecting wires,” the designer would know to place the sensor on a nonmoving part of the pedal structure. The most obvious nonmoving point on the structure from which a sensor can easily detect the pedal’s position is a pivot point. The designer, accordingly, would follow Smith in mounting the sensor on a pivot, thereby designing an adjustable electronic pedal covered by claim 4.

Just as it was possible to begin with the objective to upgrade Asano to work with a computer-controlled throttle, so too was it possible to take an adjustable electronic pedal like Rixon and seek an improvement that would avoid the wire-chafing problem. Following similar steps to those just explained, a designer would learn from Smith to avoid sensor movement and would come, thereby, to Asano because Asano disclosed an adjustable pedal with a fixed pivot.

<table>

In re Bigio

Analogous?

Larami Corp. v. Amron (E.D. Pa. 1993)

Claim 1: [a] toy comprising an elongated housing [case] having a chamber therein for a liquid [tank], a pump including a piston having an exposed rod [piston rod] and extending rearwardly of said toy facilitating manual operation for building up an appreciable amount of pressure in said chamber for ejecting a stream of liquid therefrom an appreciable distance substantially forwardly of said toy, and means for controlling the ejection.

Partial Index of Descriptions

Corresponding to Functional Status on Fig. 5 refers to Patent's Specification

1. elongated barrel
2. a chamber or tank for liquid within the confines of the barrel
3. pump
10. plunger

- Hilton holds the '746 patent to a process for ultrafiltration of dyes
  - Claim:
    - In a process for the purification of a dye . . . the improvement which comprises: subjecting an aqueous solution . . . to ultrafiltration through a membrane having a nominal pore diameter of 5-15 Angstroms under a hydrostatic pressure of approximately 200 to 400 psig, at a pH from approximately 6.0 to 9.0, to thereby cause separation of said impurities from said dye . . .
  - The Claim was amended
    - to distinguish a prior art patent, to Booth, that disclosed an ultrafiltration process operating above 9.0
    - But, disagreement as to why the lower limit is included
      - Warner says lower limit added because “foaming” below 6.0 pH
      - Hilton says process tested to 2.2 pH w/ no foaming, but gives no other reason as to why 6.0 selected

- Jury found patent infringed under DOE
- Federal Circuit affirms in fractured opinion
  - Dispute is over scope of DOE – i.e., scope of equivalents
- Supreme Court reverses

IP Survey, Fall 2015, Vetter

- DOE, broadly applied, conflicts with the definitional and public notice function of the claims
- To resolve that tension, apply DOE on an “element by element” basis

---

- Concepts are later modified by Festo
  - Where the reason for the change was not related to avoiding the prior art, the change may introduce a new element, but it does not necessarily preclude infringement by equivalents of that element
    - Festo expands this to other reasons that can trigger PHE
  - Warner-Jenkinson implements a presumption against the patentee in cases where the reason for the amendment is not revealed on the record
    - Place the burden on the patentee to establish the reason for the amendment
    - If not established, rebuttably presume that it is for a RRtoPat – in which case PHE applies to exclude what the patentee surrendered
- In the present case, no reason given for 6.0 limitation, so presumption should be evaluated on remand
**Warner-Jenkinson v. Hilton Davis (US 1997)**

- Infringement, including DOE infringement, is intent neutral and an objective inquiry
- Proper time to evaluate DOE and interchangeability for DOE purposes is at the time of infringement
  - Not at time of patent issuance
  - As a result, after-arising technology can be equivalent

**Warner-Jenkinson v. Hilton Davis (US 1997)**

- Linguistic framework of the DOE test
  - SSF-SSW-SSR or
  - Insubstantial Differences?
    - An analysis of the role played by each element in the context of the specific patent claim will thus inform the inquiry as to whether a substitute element matches the function, way, and result of the claimed element, or whether the substitute element plays a role substantially different from the claimed element
Claim 1. A component for use in manufacturing articles such as printed circuit boards comprising:

- a laminate constructed of a sheet of copper foil which, in a finished printed circuit board, constitutes a functional element and a sheet of aluminum which constitutes a discardable element;
- one surface of each of the copper sheet and the aluminum sheet being essentially uncontaminated and engageable with each other at an interface,
- a band of flexible adhesive joining the uncontaminated surfaces of the sheets together at their borders and defining a substantially uncontaminated central zone inwardly of the edges of the sheets and unjoined at the interface.

RES products use gapped adhesive.
Johnson & Johnston v. R.E. Service (Fed. Cir. 2002)

- J&J won DOE jury verdict against RES
- Federal Circuit reversed
- Specification
  - While aluminum is currently the preferred material for the substrate, other metals, such as stainless steel or nickel alloys, may be used. In some instances ... polypropylene [sic] can be used.

Johnson & Johnston v. R.E. Service (Fed. Cir. 2002)

- Claim 1. A component for use in manufacturing articles such as printed circuit boards comprising:
  - a laminate constructed of a sheet of copper foil which, in a finished printed circuit board, constitutes a functional element and a sheet of aluminum which constitutes a discardable element;
  - one surface of each of the copper sheet and the aluminum sheet being essentially uncontaminated and engageable with each other at an interface,
  - a band of flexible adhesive joining the uncontaminated surfaces of the sheets together at their borders and defining a substantially uncontaminated central zone inwardly of the edges of the sheets and unjoined at the interface.
- RES products use sheet of steel as a substrate rather than aluminum
**Johnson & Johnston v. R.E. Service (Fed. Cir. 2002)**

- Maxwell (Fed. Cir. 1996)
- Claiming fastening tabs between inner and outer soles
  - Disclosed, did not claim, fastening the tabs into the lining seam of the shoes
- So, Dedicated it!
- Policy
  - Avoided examination
  - POSITA would think its public domain

**YBM (Fed. Cir. 1998)**

- Claim magnet alloy
  - 6k to 35k ppm oxygen
    - Specification allegedly disclosed a range below 6k
  - AID used 5.45k to 6k
- Cabined Maxwell to situations where the unclaimed alternative was “distinct”

---

**Johnson & Johnston v. R.E. Service (Fed. Cir. 2002)**

- How does the patentee protect herself?
  - Claim everything?
  - What happens if the claim is later invalidated?
  - It is in the patentee’s hands to “get it right” during prosecution
Problem

A modular wall section, comprising:

- an edge-wise rectangular outer metal shell where the longer side of the rectangle is within the length range of 2 feet to 5 feet;
- one or more seals on one or both of the shorter sides of the rectangle for interfacing with other modular wall sections; and
- vertically inclined baffles extending inwardly from the outer metal shell.

1. You make AID1 in the United States and it is the same as the Diagram except that its baffles extend inwardly from a horizontal line where they connect to the outer metal shell, but at an angle that points them upward and downward, respectively from each side, at about thirty degrees measured from the long side of the outer metal shell. In other words, their connection to the shell is horizontal, rather than vertical as shown in Diagram and as recited in the claim. A POSITA would say that the horizontally inclined baffles perform a substantially similar function in a substantially similar way with a substantially similar result. What result for an infringement claim based on the hypothetical claim?

2. Add or change the following facts from problem number one. A POSITA would say that horizontally inclined baffles perform a substantially similar function with a substantially similar result, but that the way the function is performed is not at all substantially similar. What result for an infringement claim based on the hypothetical claim?

3. Add or change the following facts from problem number one. A POSITA would say that horizontally inclined baffles are an insubstantial difference as compared to vertically inclined baffles, particularly because, according to the POSITA, all artisans would recognize that horizontally inclined baffles are interchangeable with vertically inclined baffles. What result for an infringement claim based on the hypothetical claim?

4. Add or change the following facts from problem number one. The specification of the patent containing the hypothetical claim (it is the only claim in the patent, and was the only originally filed claim) states: “for any purpose that the baffles need to fulfill in this invention, horizontally inclined baffles will meet that need.” What result for an infringement claim based on the hypothetical claim?
